TO
HAVERFORD COLLEGE
MY ALMA MATER
Although it was foreseen in 1905 when Part I was issued that some time would elapse before another part could be published, exacting professional duties and the preparation of the volume on Ecclesiastes for the *International Critical Commentary* have delayed the appearance of this part longer than was then anticipated. In copying the texts published in Part I the writer began with the view that an editor should reproduce exactly what he saw as nearly as he could, thus passing on all the peculiarities of individual scribes, who often wrote carelessly. This justly laid some of the work in Part I open to criticism. The writer is convinced that an editor should reproduce the characteristic palaeography of the period, but should not copy scribal idiosyncrasies to such an extent as to make texts misleading. This may easily happen, for peculiarities reproduced upon paper make a different impression than when observed on clay. These facts have been borne in mind in copying the texts which follow, although to a limited extent scribal variations have been permitted to appear.

INTRODUCTION.

The ninety-four texts included in the present volume are of the same general character as those published in Part I, and in other publications that are devoted to the archives of the temple of Telloh.

TWO UNIQUE TABLETS.

There are, however, two which are, so far as I know, unique. They are Nos. 78 and 79 of the Haverford Collection and are reproduced in autograph on plates 79 and 80 below. These objects are made of clay and are, as one looks either at the obverse or reverse, of the general shape of a bag that is but partially filled and is tied at the top. Each of them is \( \frac{1}{3} \) of an inch thick. One of them is \( \frac{3}{4} \) and the other \( \frac{1}{2} \) inches in length. At the widest part they are respectively \( 1 \) and \( \frac{3}{4} \) and \( 1 \) and \( \frac{3}{4} \) inches. Each is perforated through its longest dimension with two holes, so that a cord could be inserted by which the objects could be hung up. Each bears a short inscription, over which a seal has been rolled making it a veritable palimpsest.

No. 78 reads: (Ob.), IV gur lxxx qa zid-se ma ur-kal; (Rev.), dub ma-na-ti ud vih

\( ^{1} \)am itu zib-ku, i. e., “4 Gur 81 qa of wheat flour, boat of Ur-Kal, account of Manati. 6th Day, month Zibku,” (i. e., the 6th month). The seal is not all legible, but we learn that it was simply the seal of the scribe who wrote the document.

No. 79 is not so elaborate. It reads simply: II gur x qa zid-se ud xxvi lam, i. e., “2 Gur 10 qa of wheat flour: day 26th.” In this case, however, we can read the whole seal. It is: gal-nin-sah dub-sar dum u r-nin-gir-su, i. e., “Gal-Ninshakh, scribe, son of Ur-Ningirsu.”

What was the purpose of these objects? One is at first tempted to think that they were meant to hang up in the temple, to serve a purpose similar to the discs of lapis lazuli (cf. BE, I, Nos. 58-62), which were cut from the larger blocks of that precious stone, to be preserved in the temple and to keep alive the memory of the generous donor, while the bulk of the precious stone was sold to fill the coffers of the treasury. This view is, however, hardly probable. One might give grain to a temple—indeed such gifts for sacrifices must have been frequent—but it is hardly probable that the memory of such gifts was preserved in this way. Had this been the purpose of these objects, it would have been implied in the inscriptions placed upon them, as in the case of the lapis lazuli objects mentioned.

Again, they can hardly be ordinary receipts for grain, for in that case their curious shape and perforation could not be accounted for. We have hundreds of such receipts, but none of them yet published are in this form.

My own belief is that in these objects we have two Old Babylonian bills of lading. It is well known that the account tablets from Telloh often mention that such and such an amount of grain came “by boat” of such and such a man (cf. below, pl. 85, I, 13, and pl. 86, No. 88, passim, and Lau, Old Babylonian Temple Records, N. Y., 1906, p. 35). One of these objects...
I O

(No. 78) mentions that the grain is “by boat of Ur-Kal”; and I am inclined to think that these
are bills of lading given to the boatman. The Code of Hammurabi, Col. XXXVI, 38-55, pro-
vides that, if a boatman sunk a cargo through carelessness, he should replace whatever portion of it
was lost. So business-like were the Babylonians in all respects, that it is altogether probable that
the boatman always had a bill of lading to show the extent of his responsibility. Such boat-
men, in the hot climate of Babylonia, probably wore little clothing in the summer months
(the one of these which is dated was written in summer), and these bills of lading were, I believe,
perforated in order that the boatman might hang them about his neck and not lose them.

If this view is true, of course the shipper, whether temple or private individual, would
also have a duplicate of the bill, so as to be able to defend himself against attempted fraud.
Indeed, so thorough were the Babylonian business methods, that nearly all important business
documents were duplicated. The duplicate bills of lading made for a temple, in case it were
the consigner of a cargo, would be made in the ordinary tablet form, to be stored in the archives
with the other tablets. Such a duplicate we have, I believe, in No. 116, published below on pl.
96. It is of the ordinary form, and is by the rolling of the seal made a palimpsest, like Nos.
78 and 79. It reads: LX QA SE LUGAL MA A-KAL-LA DUP GAL-ME-NE, i.e., “60 Qa of grain, royal
quality, by the boat of Akalla, account of Galmene.” It bears the seal: “Galmene, scribe,
son of Galnun.”

If the view here advanced is correct, the reason why so few of these bag-shaped, perforated
tablets have been found is that the duplicates made for the temple were not of this form. Prob-
able it is due to some ancient train of circumstances which we cannot now trace, that the two
here published found their way into the temple archives.

MESSENGER TABLETS.

An interesting class of tablets, of which a number are contained in this volume, I would
call “messenger tablets,” though perhaps a more correct designation would be: “provision lists of
traveling officers connected with the public service.” The tablets of this nature here published
These are not, however, the first of this class of texts to be published. Reisner published more
than thirty of them in his Tempel Urkunden aus Telloh, Berlin, 1901 (No. 192 ff.); Thureau
Dangin published a number in 1902 in the Revue d’Assyrnologie et d’Archéologie orientale, which
were republished with others in his Recueil de tablettes chaldéennes, Paris, 1903 (No. 326 ff.).
In this last mentioned work some sixty texts of this class were published, though most of them
were very short. Lau published six in his Old Babylonian Temple Records, New York, 1906
(viz: Nos. 22, 73, 110, 114, 126 and 127), while four were published in Part I of the present
work (viz: Nos. 217, 288, 297 and 345). Those included in the present volume bring the
number up to about one hundred and twenty. The nature of the contents of these tablets
may be seen from the three examples of them translated below, pp. 20-22.

So far as I know, however, the historical importance of these texts has never been set forth.
They give us important information as to the governmental methods of the empire of the second
dynasty of Ur, showing us how messengers, soldiers, and tax collectors were constantly moving
about; they reveal to us incidentally governmental methods, and something of the extent of the
empire. Most interesting is the fact that a regular system of posts (or rather an interurban
messenger system) seems to have existed, the cost of which was shared by different cities. The temple at Shirpurla (Telloh), which was apparently an office of the king's government as well as a religious establishment, furnished messengers and other government officers with provisions (certain quantities being given for their days of rest in the city, and larger quantities for the road), and portions of the provisions were charged to the cities to which the messenger belonged.

The proof that this messenger-system existed, and the reason why I prefer to call these "messenger tablets," is that, out of 363 statements of the occupations to which the men belonged to whom these grants of provisions were made, 204 were SUKKAL or messengers, and 70 were GAL-RIM, messenger's assistants, or inferior messengers. Approximately 1/4ths of all the professions noted here are messengers of one class or the other. That they were real messengers (some doubt as to the real function of a SUKKAL has existed), is shown by the fact that it is over and over again stated in these texts that they came from such a city or went to such a city, and by the fact that they were on the road more than the members of any other profession to whom the temple furnished supplies.

Most of these tablets are dated simply as to the month, but a few of them record also the year in which they were written. These years range from the 22d of the reign of Dungi to the 8th year of Bur-Sin. These tablets, accordingly, give us a glimpse of thirty years of the control of the second dynasty of Ur at its most prosperous era, and show us that a system of messengers, probably occupied with public business, was in existence at this period, apparently not unlike the system which Darius I organized at a later time for the Persian empire. Unfortunately the tablets do not record the errands on which the messengers were sent. They confine themselves strictly to noting the profession of the man, the nature of his provisions, his destination (or point of departure), and the government which is to share the expense. These men, it is noted, not only went as messengers to cities, but the tablets also record the names of several individuals to whom they were sent. In some cases these individuals were the Patesi of other cities, in some cases it is mentioned that the men to whom they are sent are at temples. Probably in all cases the individuals were officers of importance.

From the statements of the destination of messengers, and the charges for their provisions we incidentally learn something of the political organization of the empire. It appears that Nippur (RTC, 350), Susa (RTC, 326), Adamun (RTC, 328) and Sabu (below, No. 136) were ruled by Patesi. The rulers of seventeen other cities, including Anshan, afterward famous as the fatherland of Cyrus the Great, occur, but most of them are mere names to us. Their rulers are called nim-mi, i. e., Šaqaši, or Governors. Whether they were all appointees of the king, or whether he sometimes left the government in the hands of local elders we do not know. Four of the cities which are thus mentioned had a single ruler, a nim, or Governor. These single rulers may have been Patesi, for one text (Reisner, Urkunden, No. 195) refers to the Patesi of Sabu as nim, but of their cities little is yet known.

1 See, e. g., Reisner, Urkunden, 194, where the nim (=Šaqaš, governor), of Šusamli, is said to have received 30 qa of food, royal quality; ibid. No. 197, where the governor of Šumaš, receives the same amount; ibid. No. 215, where the governor of Šaša receives 40 qa of drink, 30 qa of food of split grain, royal quality, and 10 qa of wood oil. Usually the messenger received for it in the name of the rulers of his city. Thus in HLC, 117, the provisions of the messenger, Susasu are charged to the nim. . . . nim (=Šaqaš, ruler), of Gisa, and Susasu receipts for them as their "Gir." In HLC, 136, the provisions of the messenger Zanati are similarly charged to the Patesi of Sabu, the messenger acting as his "Gir."
Messengers were not, however, the only officers to whom provisions were furnished. Of the 363 charges for provisions noted above 50 were made to TU-UŠ-GAL officers. TU-UŠ officers appear in many texts. Some of them were subject to Patesi. TU-UŠ-GAL indicates a high TU-UŠ officer—one that was over others. Two of these apparently held a still higher office, for they are called TU-UŠ-GAL-GAL (cf. RTC, Nos. 359 and 373). One held a still higher office; he is called the king’s TU-UŠ-GAL (RTC, 337). These TU-UŠ-GAL who are next in number to the messengers mentioned in this class of tablets, were probably concerned with the collection of taxes. Taxes were collected in kind, as in the East to this day. The sign TU is the sign for shekel and probably these men were the public revenue officers.

Next in number to these officers was a kind of soldier, called “a man with a long spear” (GAL GIŠ-KU-GU-LA). There are 31 charges against these. They were probably connected in some way with the king’s army. I have noted two charges of provisions to scribes, and a number to DUMU-NU-BANDA. The Nu-Banda was an officer higher than a shepherd. Perhaps DUMU-NU-BANDA may mean “member of the Nu-Banda guild” or profession. Possibly, like the TU-UŠ-GAL, their traveling was connected with tax-gathering.

For the most part, it is probable that these men traveled on animals. The usual supply of provisions was 5 qa of drink and 5 qa of flour and 3 qa of oil. As the qa was more than a gallon (see below, p. 18) a man could not have carried all these. In five instances, however, they are said to have traveled by boat. A study of the statistics of this class of texts affords one other interesting fact, which seems to me to have a historical significance. There are in these tablets 128 references to cities as the destinations of messengers or other officers, or the places from which officers have come. Of these 128 references, 46, or more than one-third, are to the city of Susa. Next to Susa, but a long way behind it, comes Anshan with 16. Sabu has 11; Nippur, 9; Adamdun, 8; Simash, 5; Kimash, 4. Two cities are mentioned three times, two twice, while nineteen others are each mentioned but once. Ur is mentioned but three times. As the dynasty took its rise at Ur and the kings called themselves kings of Ur, we are led to expect that Ur would hold a more important place in this inter-urban system of messengers than it seems to have done. Why, on the other hand, should Susa have been the destination of so many of the officers? Susa, we know, was not independent at this time as its local ruler was only a Patesi, called Galzagal. The only sufficient explanation of the fact that Susa was, apparently, the center whence this messenger-system radiates, seems to me to be the supposition that Dungi and Bur-Sin had made it their residence. The climate of Susa in the elevated lands of Elam was more salubrious than that of Ur in the marshes of southern Babylonia, and such a change of residence on the part of the monarch is not in itself improbable. Moreover, the temple at Susa was one of those which Dungi rebuilt. (See his inscription, Délégation en Perse, VI, 20.) If Susa was the center of government, the frequency of the passage of messengers to and from it is satisfactorily accounted for.

At all events some important reason must lie behind the fact that so many messengers went to and from Susa.

1 I have not collected full statistics of references to these officers. Six were included in the 363 officers mentioned above and I remember having seen three or four other references to them.

2 These are Reisner, Urkunden, 195, 223; Thureau Dangin, RTC, 342, and HLC (below), 101 and 138.

3 See RTC, No. 326. Spelled also Gazagaal, ibid., No. 325.
SOME HITHERTO UNEXPLAINED NOTATIONS OF NUMERALS.

In pl. 16 of Part I of this work the combination JK occurs as a numeral three times: col. iii, 15; v, 10, and vi, 2. In each case it occurs before KeyId, the well-known notation for 36,000. When the volume was published in 1905 I recognized that this was a numeral larger than 36,000, but partly because the first lines of the tablet were illegible and partly because a number of abbreviations were used in the tablet—abbreviations which I did not then understand—I was unable to determine what number the sign JK represented. I am now able to demonstrate that it denotes the number 216,000.

The tablet records first the collection and then the distribution of MA-NUM wood, IGI-NU-MA-NUM (some small objects connected in some way with the MA-NUM wood), and binding-reeds. The wood is measured in talents and manas, but the other objects are counted. As the binding-reeds were the most numerous it is in the totals of these that the number 216,000 occurs.1

Up to col. iii, 15 of the tablet the account deals with the collection of the reeds, etc., and as col. i, 2 evidently contained a large number of these reeds, but is now in part broken away, we turn to the last half of the tablet, where the reeds are distributed, for our demonstration. Except in the totals the numbers are expressed by means of well-known signs. They are as follows:

Col. iii, 18, 54,492
" iv, 5, 199,589
" iv, 11, 4,140

This total is written in col. v, 10 as follows:

\[
\begin{array}{l}
\text{JK} = 216,000 \\
\text{KeyId} = 36,000 \\
\text{JK} = 3,600 \\
\text{KK} = 2,400 \\
\text{KK} = 171 \frac{1}{2}
\end{array}
\]

This clearly proves that JK = 216,000.

Following this we have the following numbers written in the well-known notation:

Col. v, 12, 1,120
" v, 13, 640
" v, 17, 3,075

This added to the previous total, 258,171 1/2 gives as a grand total, 263,006 1/2

1In Thureau Danos's Recueil de tablettes chaldéennes, Nos. 305 and 306 record similar collections of reeds for binding but the numbers are not so large as in the HLC text.
In col. vi, 2 we gave the grand total written as follows:

\[
\begin{align*}
\text{\begin{tabular}{c}
\end{tabular}} & = 216,000 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 36,000 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 10,800 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 263,006
\end{align*}
\]

which just balances the total obtained in the other way and again proves \(\text{\begin{tabular}{c}
\end{tabular}} = 216,000\). All these reeds are present or have been taken away for some purpose. In col. vi a statement of the reeds that are lacking follows, thus: Col. vi, 6, 41,250\(\frac{1}{2}\) reeds are lacking.

Add this to the previous total, \(263,006\frac{1}{2}\)

and we obtain as another grand total, \(304,256\frac{1}{2}\), which is the total of the reeds received as stated in col. iii, 15 in the following notation:

\[
\begin{align*}
\text{\begin{tabular}{c}
\end{tabular}} & = 216,000 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 72,000 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 14,400 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 1,800 \\
\text{\begin{tabular}{c}
\end{tabular}} & = 56\frac{1}{2}
\end{align*}
\]

which gives the same total, \(304,256\frac{1}{2}\)

and affords a third proof that \(\text{\begin{tabular}{c}
\end{tabular}} = 216,000\).

Having demonstrated thus indubitably that the sign in question is a notation for 216,000, some interesting results may be obtained by applying the fact to the interpretation of some other texts. In Hilprecht's *Babylonian Expedition*, Series A, Vol. XX, No. 29, obverse, col. iv, 8 our sign occurs. The first column of this text is broken away. The second column is taken up with ways of expressing numbers of Qas—first, from 10 to 20, then the numbers increase by tens to 60, then, by sixties to 300, which makes a Gur. This Gur stands in the last remaining line of col. ii. As col. iii begins with 18 Gur we learn that sixteen lines are broken away from col. ii. The enumeration of Gurs is carried in the sixteen lines of col. iii to 300 Gur. The first line of col. iv begins with \text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}}, i.e., 28,800 Gur. There were, then, fifteen additional lines to col. iii. In four of these the increase advanced by sixties to 600 = \(\text{\begin{tabular}{c}
\end{tabular}}\); in five others it advanced by six hundred at a time to 3,600 = \(\text{\begin{tabular}{c}
\end{tabular}}\); and in six others by thirty-six hundred at a time to \(\text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}} \text{\begin{tabular}{c}
\end{tabular}} = 25,200\). As the sign \(\text{\begin{tabular}{c}
\end{tabular}}\) could not be repeated more than five times in one of these columns without being written in part one under the other, these fifteen lines occupy exactly the space of the seventeen lines which we should expect to find here on
account of the way the tablet is broken, and on account of the sixteen lines which we proved had been lost from col. ii.

Now the first eight lines of col. iv are as follows:

It is clear at a glance that line 1 = 28,800 Gur; l. 2 = 32,400 Gur; l. 3 = 36,000 Gur. If now we apply to the interpretation of the following lines the principle obtained by a study of the preceding columns, the notation should now increase by thirty-six thousand at a time. We accordingly interpret the following lines thus:

1. 4 $\text{\textsuperscript{1}}$ = 72,000 Gur;
1. 5 $\text{\textsuperscript{1}}$ = 108,000 Gur;
1. 6 $\text{\textsuperscript{1}}$ = 144,000 Gur;
1. 7 $\text{\textsuperscript{1}}$ = 180,000 Gur;
1. 8 $\text{\textsuperscript{1}}$ = 216,000 Gur.

\footnote{The facts concerning the missing parts of cols. ii and iii of the obverse of BE, XX, No. 29 may be mathematically demonstrated to the eye as follows:}
This was provable by inference from Hilprecht's tablet alone, as we have shown. It
might, however, have been regarded as speculative and uncertain, but for the confirmation of the
Haverford tablet, which proves independently that \( \square = 216,000 \). This demonstrates
that the factors which intervene between 36,000 and 216,000 have been correctly interpreted
above, and gives us four additional new notations, viz: \( \triangle = 72,000 \); \( \bigtriangleup = 108,000 \);
\( \bigtriangledown = 144,000 \); and \( \blacklozenge = 180,000 \). I call these new notations, for, so far as I know, but one of
them has been mentioned before. Reisner in the *Sitzungsberichte* of the Berlin Akademie,
1896, p. 420, suggests the possibility that \( \bigtriangleup \) may have been used in land measure with a value
corresponding to that proved for it above. In the corresponding table of his *Tempel Urkunden
aus Tellah*, 1901, however, he gives instead the notation, \( \bigtriangleup \) for the number, and this latter
notation is really the one employed in the Tellah tablets which have hitherto been published.

The ideograms to which we have thus given meanings occur in a broken, Neo-
Babylonian syllabary published in CT, XII, 24, where their Sumerian names are given, though the meanings are broken away. Thus

1b, read: \( \text{sar-u} \), \( \bigtriangleup = [10 \text{ sars}] \) (i.e., 36,000).
2b, read: \( \text{sar-nis} \), \( \bigtriangleup = [20 \text{ sars}] \) (i.e., 72,000).
3b, read: \( \text{sar-u-su} \), \( \bigtriangleup = [30 \text{ sars}] \) (i.e., 108,000).
4b, read: \( \text{sar-nimin} \), \( \bigtriangleup = [40 \text{ sars}] \) (i.e., 144,000).
5b, read: \( \text{sar-ninu} \), \( \bigtriangleup = [50 \text{ sars}] \) (i.e., 180,000).
6b, read: \( \text{sar-dis} \), \( \bigtriangleup = [60 \text{ sars}] \) (i.e., 216,000).

This table thus demonstrates that the number 216,000 might be written \( \bigtriangleup \) as well
as \( \bigtriangleup \). The Sumerian names here given are made up of the word \( \text{sar} \) and the Sumerian
words for the various numerals, and are proof that our interpretation is correct.

Indeed, if we refer again to the text of BE, XX, No. 29, it appears that the number
216,000 (\( \bigtriangleup \)), when used in the notations of land measure to designate a number of *Bur*
(i.e., 3,600 *Bur*) is written \( \bigtriangleup \) (see rev. iv, 7). This last number follows the numbers,
\( \bigtriangleup \), and \( \bigtriangleup \) just as \( \bigtriangleup \) does in obv. iv, 8, thus proving that the two had the same
numerical value.

In the Pennsylvania tablet there is but one other notation higher than that for 216,000.
It is \( \bigtriangleup \) in the obv. iv, 9, and \( \bigtriangleup \) in col. iv, 8, of the reverse.
This is nothing else than \( \text{sar-gal} \), i.e., "the great sar; its double," i.e., 432,000.
The principle of increase followed in the earlier part of the text confirms this, showing that
in the one case we have the notation for 432,000, and in the other, of the corresponding
number of *Bur* (i.e., 7,200 *Bur*).

It appears from this tablet that the common and unambiguous notation known to the
scribal school from which this tablet comes did not extend beyond 432,000.1

In the Neo-Babylonian syllabary in CT, 24 already referred to, two other signs appear

1i.e., \( \text{sar} \) is for \( \text{sun} \). The multiples in Assyrion are expressed by the form \( \text{fu-ul} \) (see Ungnad, *Babylonisch-Assyrische Grammatik*, §193), while in Arabic the form \( \text{fu-ul} \) expresses a fraction (see Wright's *Arabic Grammar*, 3d ed., § 363).

1That they had an ambiguous notation extending to 12,960,000, Hilprecht has shown in his introduction to BE, XX, p. 26.
in the series after the sign ŠAR-DIS (\(\text{SV}\)), which has been shown to denote 216,000. They are

1. 7, ŠAR-GAL-DIS, \(\text{SV}\),
2. 8, ŠAR-GAL-MIN, \(\text{SV}\).

If we had this syllabary only in its present broken condition, we might infer that these two signs completed the sexigesimal series, and that the notation was as follows: \(\text{SV} = 216,000; \text{SV} = 2,160,000; \text{SV} = 12,960,000.\) Such an inference would, however, lead us into error. The syllabary is not, like the tablet published by Hilprecht, giving us a regularly ascending series, which increases according to regular increments, although it is true that the first six numbers in the column were arranged according to the tens, from ten to sixty. A study of the rest of the column shows, however, that the compiler of the syllabary was collecting rather all the compounds of ŠAR which were known to him, and that this regular numerical order extends no further. The scribe was following no such system as appears in the Pennsylvania tablet. When two signs occur which have the same value they are written successively, the more complex of the two being written last. This can be clearly shown by a comparison with BE, XX, No. 29. Thus \(\text{SV}\) is but a more compact writing of \(\text{SV}\), which has already been proven to denote 216,000. Similarly \(\text{SV}\) is but a more compact writing of \(\text{SV}\) or \(\text{SV}\) (shown above to denote 432,000). The \(\text{SV}\) is simply written within the \(\text{SV}\), as is the figure 2 \(\text{SV}\) by which the word form of the numeral \(\text{SU-nu-ŠUM}\) is replaced. The Neo-Babylonian list of CT, XII, 24 is, accordingly, a later transcript of the earlier list published by Hilprecht.

It should be noted in connection with these signs that still another notation for the number 216,000 is employed by Gudea. It is \(\text{SV}\) \(\text{SV}\) (Stat. B, iii, 10), and is simply another device to indicate that the ŠAR is multiplied by 60.

To recapitulate: Our discussion has shown that the texts designated afford the following hitherto unrecognized numerical notations:

\[
\begin{align*}
\text{SV} & = 72,000, \\
\text{SV} & = 108,000, \\
\text{SV} & = 144,000, \\
\text{SV} & = 180,000, \\
\text{SV} & = 216,000, \\
\text{SV} & = 216,000, \\
\text{SV} & = 216,000, \\
\text{SV} & = 432,000, \\
\text{SV} & = 432,000, \\
\text{SV} & = 432,000.
\end{align*}
\]

\(^1\)See Thureau-Dangin, L'Écriture Cuniforme, No. 491, and Sumerischen und Akkadischen Koniginschriften, pp. 68, 69.
Of these is the only one yet found in the business documents from the temple archives of Telloh hitherto published. All of them with three exceptions were known to the scribes of Nippur about 2000 B.C. Three of them (\(\text{\textashape}\), \(\text{\textashape}\), \(\text{\textashape}\))—natural developments from the earlier forms—have as yet been found only in the Neo-Babylonian Syllabary published in CT, XII, 24.¹

THE PRICE OF WHEAT IN ANCIENT BABYLONIA.

The tablet of Dr. Gould (below, pl. 100, translated on p. 22 ff.) gives some interesting quotations of the prices of Babylonian wheat. Fortunately there are two inscribed objects, one from the reign of Dungi and one from the reign of Gimil-Sin, on each of which the ancient weight is stated, and the actual weight of which is known. (Cf. Weissbach, ZDMG, LXI, 395, and the original publications of them, Revue d'Assyriologie, V, 57 ff. and Collection de Clerq, Catalogue, II, 83 ff. and pl. viii, No. 3.) Averaging the value of the unit of weight which results from these two objects, we learn that, if Babylonian silver had the same degree of purity as American coinage, the value of the silver she was .001664 cts. We reach the result thus: Dungi's diorite (?) pyramid is inscribed as 4 Mana and weighs 248 grammes .'. 30 shekels = 248 grammes .'. 1 shekel = 8.0206 + grammes .'. 1 she = .1 of a shekel = .044589 grammes. Gimil-Sin's diorite object is inscribed as 5 manas and weighs 2510.975 grammes, which makes the she = .046423 grammes. Averaging these we obtain .0455 grammes as the average she of the period. A gramme = 15.432 + troy grains .'. 1 she = .686714 troy grains. The American dollar = .412.5 grains .'. 1 she = .844414 of $1.00 or $.001664.

Taking the measures of capacity as determined by Thureau Dangin (Journal Asiatique, 1909, p. 101), a shekel of capacity equaled .583 gills. We reach the result thus: 1 qa = 40.4 decilitres, 1 decilitre = .845 U. S. gills .'. 1 qa = 34.138 gills = 4.267 qts., 1 shekel = .1 of a qa .'. 1 shekel = .070116 qts.

The tablet of Dr. Gould, translated below (p. 22 ff.), gives three prices at three different times during the year. The first price was 15 shekels of wheat for 12 she of money; the second 7 shekels of wheat for 7 she of money; and the third, 3 shekels of wheat for 5 she of money. These prices represent the value of wheat at three different periods of the year, as the harvest became more and more remote. These three prices were, when translated into American terms by means of the above equations, respectively .596 cts., .745 cts. and $1.23 per bushel. This was for wheat of the finest quality in a country in which there were several grades of wheat.

If Babylonian silver was unalloyed, which I regard as improbable, the price of wheat was slightly higher. The American dollar contains 3714 grains of pure silver, so that, if the she was pure silver, it was worth $\frac{24}{214} of a dollar, or .001847 + cts. This would make the three prices quoted in this tablet respectively .665 cts., .83 cts., and $1.38 per bushel.²

¹Cf. Meissner's Selten assyrische Ideogramme, Nos. 6548, 6549 and 6557.
²These arithmetical calculations Mr. L. H. Rittenhouse, Instructor in Engineering in Haverford College, has kindly verified.

For details as to Babylonian weights and measures see the article of Reinsen in the Sitzungsberichte of the Berlin Academy, 1906, referred to above; the article of Weissbach in ZDMG, LXI (1907), pp. 379-402; and that of Thureau Dangin, Journal Asiatique, 1909, pp. 79-111. Cf. also Meyer, Geschichte des Altertums, 3rd Auf., Band I, 1st Hälftte, 1909, pp. 517, 518.
When, however, we compare these values with values which are known to have prevailed in the East in more recent times, it is probable that the silver was alloyed and that the first list of prices is nearer the truth.

Tablet No. 39 (pl. 70), below, contains an interesting statement, though it cannot represent the price of wheat. It reads

1. DJX GUR CXI BAR QA 3B LUGAL.
2. BA-SI-TA.
3. X LAL € GIN AŠAG-UD CXXI QA-TA.
4. GUR VI QA CXXI QA.
5. GAR-RA MU 3A-AM-RU
6. A-RA SIŠ-EAL-ŠA BA-Á-GAR.

Rev. 1. MU-GUR.
2. LAL-RI. DJXII. GUR. CXXI BAR. QA
3. GUR. GA-SAG-GA.
4. DUB-NU-TUG
5. GAR-RA GUR.
6. GAL 4 NIN-GIR-SU DUMU UR 4 BA-U
7. MÚ-CU-SÁ. B-BA-ŠA-IS 4 DA-GAN BA-RU

Rev. 1. It is present.
2. There are lacking 512 gur, 15½ qa.
4. The tablet is unsealed.
5. Deputy-Gir.
7. The year after the E-BA-ŠA-IS of Dagon was built.

It follows from this statement that the grain was reckoned at the rate of 240 qa of grain for a shekel of money, which would be at the rate of a little less than 1 cent per bushel if the silver was alloyed, and a slight fraction over a cent per bushel if the silver were unalloyed. The money was a small percentage of the value of the wheat. Why it was allowed is not clear. There are various possibilities, but we do not know which to choose.

6. Agua, messenger;
7. 3 qa of drink, 2 qa of food,

¹ HLC, No. 24 (Pl. 16), as well as RTC, Nos. 205 and 206, show that in the absence of binding-twine reeds in large quantities were gathered for use in binding. Apparently these men were employed in carrying such reeds to those who were using them.

² This is not to be read here us·sa (= "after" or "following") as in that case it would precede LUGAL. It stands where it does to show that these men were binding something (perhaps grain) for the king. They were using the reeds which those mentioned in the previous line brought to them. This month is the same as the month Siman of later times, in which, according to Neo-Babylonian contracts, the harvest occurred.

³ This is a difficult phrase and the rendering is uncertain. That suggested is based on the fact that in Meissner's Ideogramme No. 2049 gives TIG·ZIKUM·A = lqš·a = "take," "catch," and the sign PES originally pictured a fish. (See Barton, Semitic Studies in Memory of William Rainey Harper, II, 235 and 253.)

57. 26. The number of qa in this account are inaccurately enumerated.
CORRECTIONS TO PART I.

P. 7 erase the last sentence of the second paragraph, beginning: “A comparison,” etc.
P. 9, l. 7, read “for business” instead of “of food-making (or food-makers)”.
P. 9, l. 15, read “for messengers to” instead of “deposited at.”
P. 9, l. 34, read “BA-AN-TUR” instead of “BA-AN-LIL.”
P. 10, No. 220, rev., 4, read “Lugalmagurus, messenger” instead of “Lugalmagurus-sukkal”. Also strike out dash before SUKKAL.
P. 10, No. 144, rev. 3, begin the line of translation with capital T.
P. 10, No. 329, l. 1, read “LVII CXX QA” instead of “CLXXVII,” and translate “57 Gur 120 qa” instead of “177 talents.”
P. 10, No. 188, l. 1, read “XV” instead of “XXV.”
Ibid., read “gur” instead of “talents” in the translation of lines 1-4.
Ibid., l. 5, read “XXX X” instead of “UŠU-U” and translate “39” instead of “of Ushu.”
P. 11, No. 288, rev., l. 3, read “GIN-NA” instead of “GUB-NA” and translate “to Susa they went” instead of “at Susa they presented.”
P. 11, No. 47, l. 1, read “CCC” instead of “V” and translate “300 Gur” instead of “5 talents.”
P. 11, No. 193, in obv. l. 1 and rev. lines 1 and 5 read “SAG” instead of “DAMAK.”
Ibid., rev., l. 7, read “to” instead of “of.”
P. 12, No. 113, l. 2, read “NIN-ŠID-AG” instead of “GAR-RA-AG” and translate “for the transaction of business” instead of “of food-making.”
P. 12, No. 185, l. 1, read “III CXX QA” instead of “CXXIII” and translate “3 Gur 120 qa” instead of “123 Talents.”
P. 13, No. 324, l. 1, read “BAR” instead of “MISLA.”
P. 13, No. 334, l. 4, read “BA-AN-TUR” instead of “BA-AN-LIL.”
For corrections to pp. 15–18, see above pp. 23–26.
P. 19, No. 12; in the date insert the word “after” after the word “year.”
P. 26, No. 579; in the date insert “high priest of” after the word “year,” read “ninth year of Bur-Sin” instead of “reign of Dungi(?).”
